

Note: This instruction is for running the program in local machine (only on your laptop)

Before you start, you need to install Python. If you do not have Python already installed you can download it [here](#). The version must be Python 2.7.13.

First, go to Documents, or wherever you want to place the program file.
Inside the Documents, create a folder. Let's name it *tempDirectory*.

Second, put our program folder inside *tempDirectory* folder. Our program folder name is *oncology*.

Then, we need to go to terminal. We can search for *terminal*, and click it.

Then go to the program file folder, where you put the program. Type the below command.
cd Documents/tempDirectory/oncology

To install the required packages, type the below command line by line (not all of them at once)

pip install flask
pip install rp2
pip install numpy
pip install plotly

Now, we can run the program.

python run.py

Open your browser and paste the following address.
